Partial Knee Joint Replacement

It is also referred to as unicompartmental arthroplasty. Surgeons think of the knee as having three compartments. Medial compartment, lateral compartment and patello-femoral compartment. I see an occasional patient who has arthritis in only the medial or lateral compartment and nowhere else. One compartment. The rest of the knee is fine. It is rare. That person could be a candidate for a partial knee replacement.

There are other factors too that would influence the decision. If everything seems to be right, a partial knee replacement might work for that person. It is less surgery and they seem to recover faster. A big factor is that if the other parts of the knee wear out you have to come back, have the uni taken out and have a regular total knee replacement. A patient has to go into this surgery knowing all the facts. The procedure has a place, but a limited one.

Total Knee Replacement

More joint replacements are performed on knees than any other joint. In a total knee replacement (arthroplasty) the worn out cartilage surfaces of the thigh bone (femur), shin bone (tibia) and patella (kneecap) are replaced by parts called a prosthesis. The various parts are made of metal alloys and a medical plastic called polyethylene. The other parts of the knee such as ligaments and muscles that connect the bones remain largely intact.

Total knee replacement is a major surgical procedure done under general or spinal anesthesia. It always requires careful pre-operative evaluation of any medical problems that the patient has. Laboratory studies and an electrocardiogram plus other studies are undertaken before any total knee replacement.

Once the decision has been made to go ahead with the total knee replacement it is up to me to decide which total knee prosthesis is right for a particular person.

In most cases I have chosen an LCS Total Knee prosthesis made by DePuy Orthopaedics, Inc. As you can imagine there are a large number of prostheses to choose from.

I have chosen this prosthesis because of its truly unique design and amazingly long life.
Mobile Bearing Knee

LCS is different from other knee replacements in the following important way. The human knee is not a hinge even though patients mostly think of it in that way. There is an important rotation component to knee motion, which is extremely important in how the knee normally functions.

LCS is capable of bending and rotating which other total knees do not do.

I need to refer you to the office teaching website www.orthopodsurgeon.com for much more pertinent and detailed information about this unique total knee prosthesis. It would be worth your time to read it.

Next week I would like to talk about what happens in the hospital and when you go home. Also we need to cover what your expectations should be regarding activities after a knee replacement.

Gratiot County Herald Archive and Office Website

A great source of all of the musculoskeletal information that you need can be found at www.orthopodsurgeon.com. It contains a tremendous amount of musculoskeletal information that can be very helpful to you, your family and friends.

In addition, it is your entry to the Gratiot County Herald archive of all articles I have written for Gratiot County Herald Orthopaedic Connection. All of the articles are listed, most recent all the way back to the first. A couple of mouse clicks and the whole article appears.

The articles and website cover every thing I treat in the office and hospital. Please log on and check it out.

Our goal is simple – To help people return to more pain free, functional lives. I specialize in you.

Good health. Good life. All the best to you.

Be well.

Dr. Haverbush
